

10-Short-Link-App

Bonus: Robomongo

- robomongo is a mongodb database viewer. you can find it at robomongo.org
- you can get the free version
- once installed, open it and select the create link
- once there we need to change address port, to find out what the port is of your Mongo, headover to your terminal
- and run Mongo, type: meteor mongo
- and you should be able to see
- in this case our port is 3001

```
joses-MacBook-Pro:short-link mendoza$ meteor mongo  
  
MongoDB shell version: 3.2.6  
  
connecting to: 127.0.0.1:3001/meteor
```

- Before saving it go ahead and press test
- go ahead and save it and double click it on the next window
- right here the only thing we care about is the Collection folder
- under the Collections folder there are 2 files, go ahead and right click users, and click View Documents
- right there we can see all of the users we created when we were testing our short link app
- we can even modify data in there
- now lets explore the other file called meteor_accounts_login.... and double click and View Documents
- but the one that is useful is the users for now
